National Climate Change Adaptation Strategy for Sri Lanka 2011 to 2016
National Climate Change Adaptation Strategy for Sri Lanka
2011 to 2016
(Final Draft)

November 16, 2010
**Strategy Development Team:**
Nayana Mawilmada - Team Leader/Strategic Planning Specialist, Sithara Atapattu - Deputy Team Leader/Coastal Ecologist, Jinie Dela - Environmental Specialist, Nalaka Gunawardene – Communications & Education Specialist, Buddhi Weerasinghe – Communications & Media Specialist, Mahakumarage Nandana - GIS Specialist, Aloka Bellanawithana - Project Assistant, Ranjith Wimalasiri - EMO/Project Counterpart – Administration and Coordination, Nirosha Kumari - EMO/Project Counterpart – Communications.

**Acknowledgements**
The team appreciates and would like to acknowledge all the support provided by the Climate Change Secretariat, Ministry of Environment and the Asian Development Bank on this initiative. The team would also like to extend their sincere gratitude to the hundreds of stakeholders who have worked with, guided, and encouraged them over the past months to develop this strategy.

EXECUTIVE SUMMARY

Living and coping with uncertain impacts of climate change is no longer a choice; it is an imperative.

Sri Lanka is a negligible contributor to global warming. However, as a nation, we are highly vulnerable to the impacts of climate change, which include:

1. increases in the frequency and intensity of disasters such as droughts, floods and landslides;
2. variability and unpredictability of rainfall patterns;
3. increase in temperature; and
4. sea level rise, among others.

Climate change vulnerabilities cut across many sectors in the economy, and threaten to compromise the significant achievements the country has recorded in the last 20 years. Investments currently being deployed as part of our ongoing development drive are also at risk.

This document outlines a comprehensive National Climate Change Adaptation Strategy (NCCAS) which lays out a prioritized framework for action and investment for the 2011-2016 period aimed at systematically moving Sri Lanka and its people towards a climate-change resilient future.

The NCCAS mirrors and supports Sri Lanka’s national development strategy as articulated in the Mahinda Chintana and is aimed at ensuring its success and sustainability. Accordingly, key findings of sector-based analysis were synthesized into an integrated framework, and structured into the following 5 Strategic Thrusts:

1. Mainstream Climate Change Adaptation into National Planning and Development
2. Enable Climate Resilient and Healthy Human Settlements
3. Minimize Climate Change Impacts on Food Security
4. Improve Climate Resilience of Key Economic Drivers
5. Safeguard Natural Resources and Biodiversity from Climate Change Impacts

Under each of the Strategic Thrusts, key Thematic Areas for action, along with priority Adaptation Measures, have been identified.

An estimated 47.7 billion rupees in incremental additional financing, beyond current and ongoing expenditure, will be required to implement the NCCAS over its 6 year duration.

The vast majority of these financial resources are expected to be channeled directly to the broad base of agencies and stakeholders (both within Government and beyond), to finance and implement climate change adaptation interventions of varied scale. The Ministry of Environment will play a facilitation and coordination role in the process.

Hundreds of stakeholders representing a cross section of government institutions, national NGOs, professionals, and academia covering a wide range of sectors were engaged in the process of developing this strategy.

A pipeline of projects related to each Strategic Thrust has also been developed as an integral part of the NCCAS development process, to expedite investment.

Having emerged as an environmental concern, climate change is now regarded worldwide as an overarching development challenge. It can seriously affect the economic growth, food security, public health, cultural heritage, social stability and even the national security of countries.

Sri Lanka is a negligible contributor to global warming. However, as a nation, we are highly vulnerable to the impacts of climate change, which include:

- increases in the frequency and intensity of disasters such as droughts, floods and landslides;
- variability and unpredictability of rainfall patterns;
- increase in temperature; and
- sea level rise, among others.

These vulnerabilities cut across many sectors in the economy, and threaten to compromise the significant achievements the country has recorded in the last 20 years in increasing incomes and reducing poverty, as well as our ongoing development drive.

Living and coping with uncertain impacts of climate change is no longer a choice; it is an imperative. Sri Lanka needs to address climate change adaptation to ensure that its economic development can continue without disruption or setbacks, and investments in poverty reduction, food and water security and public health will not be undone.

This document, which outlines a comprehensive National Climate Change Adaptation Strategy (NCCAS), aims to achieve just that. The following pages lay out a prioritized framework for action and investment aimed at systematically moving Sri Lanka and its people towards a climate-change resilient future.
CHAPTER 2

THE STRATEGY DEVELOPMENT PROCESS

Guiding Principles in Strategy Formulation

The strategy development team has followed five principles to guide its activities and planning process. They were to:

- **Pursue pragmatic solutions, in line with the national development agenda**
  The NCCAS is focused around supporting the successful implementation of the Mahinda Chintana development framework and ensuring its sustainability for the long term. The National Physical Planning Policy and Plan (NPPP), the National Environment Policy and associated action plan, as well as the National Action Plan for Haritha Lanka Programme (HLP) have also been considered.

- **Initiate process to mobilize significant investments**
  Consistent efforts have been made to elevate thinking above a mere advocacy agenda, and to focus on rational means to safeguard Sri Lanka’s national interests and mobilize resources to support and sustain development.

- **Mobilize people/institutions to work towards integrated solutions**
  Focus has been placed on stimulating stakeholder interest and initiative to identify climate change risks and adaptation measures across key sectors. All efforts have been taken to capture synergies, and position Sri Lanka to take advantage of opportunities to mobilize resources to support climate change adaptation.

- **Harness the wealth of expertise and knowledge already available in Sri Lanka**
  The strategy development process has been carried out with clear acknowledgement that a vast body of knowledge resides with a dispersed and diverse range of stakeholders and experts. All efforts have been made to consult as broad a base of stakeholders as feasible.

- **Contribute towards developing the nation**
  Adapting to climate change is a contribution towards developing the nation. As such, the process has consistently adopted a pro-active stance in engaging stakeholders across all sectors and seeking ways to ensure that Sri Lanka’s development trajectory can be supported and made more climate change resilient.

The Climate Change Adaptation Planning Process

The NCCAS was developed through a three stage process, as follows:

- Preparing Sector Vulnerability Profiles (SVPs) for key sectors, which outline the current status of the sectors and the main potential climate change risks facing Sri Lanka.
Adopting a participatory process for the above through working groups comprising a range of stakeholders, as well as individual consultations with key people, to refine content of the SVPs and to identify and prioritize areas for future investment.

Synthesizing these sector based analyses into one cohesive national adaptation strategy, which includes a clear program for priority action and investment based on clearly defined strategic priorities.

Over 500 stakeholders representing a cross section of government institutions, national NGOs, professionals, and academia covering a wide range of sectors were engaged in the process. A list of key persons consulted is in Appendix 1.

**Sector Vulnerability Profile Development**

SVPs have been developed for the following key groupings of sectors, where climate vulnerabilities are expected to be critical in the Sri Lankan context:

- Agriculture and Fisheries
- Water
- Health
- Urban Development, Human Settlements & Economic Infrastructure
- Biodiversity and Ecosystem Services

These SVPs are concise background documents which support the NCCAS and were developed as a means to document the current status of each key sector and identify the key climate change related issues that need to be addressed.

The set of SVPs provides a summary snapshot of each sector grouping, highlighting their positioning in the national development trajectory, and summarizing information on the nature, scale, and geographic distribution of vulnerability to climate change impacts across key sectors. The documents also provide insight to the background that exists to position adaptation activities/interventions.

**From SVPs to Strategy: Establishing Strategic Priorities**

As the SVPs evolved and extensive consultations were carried out, several recurrent observations came to the fore, and formed the foundation for establishing strategic priorities for the NCCAS. These observations include:

- Climate change-related risks cannot be considered in isolation. They are often linked to, and will likely aggravate existing development disparities and problems.
- Problems are rarely isolated clearly within one sector—cross sectoral linkages are common
- A multidisciplinary approach is critical in order to effectively understand and address climate change concerns
- Integrated solutions and adaptation measures straddling multiple sectors are necessary to address risks to key national development initiatives

Sri Lanka’s development framework as articulated in the Mahinda Chintana Idiri Dekma, and the Mahinda Chintana 10 Year Horizon Development Framework (MC10YP), outlines the overarching development strategy Sri Lanka is pursuing. Several key pillars of the
national development strategy are apparent upon evaluation of the approximately Rs. 4.3 trillion investment framework planned for the 2006-2016 period in the MC10YP.

- Investments in human settlements, which combine initiatives in housing, urban development, and drinking water, among others, total over Rs. 947 billion.
- Investments in food security—combining irrigation, agriculture, fisheries, and nutrition total over Rs. 360 billion.
- Investments in key economic drivers such as transport infrastructure, tourism, and plantations exceed Rs. 1,454 billion.
- While planned investment in environmental and natural resource conservation is a relatively modest Rs. 18.5 billion, conservation and effective management of these resources is recognized as a core principal in the development strategy.

Collectively these core pillars of the MC10YP represent over 65% of the total planned investments in the 10 year plan. In socio-economic terms, these key strategic areas which underpin the national development strategy, effectively reach the entire population of the country. Success and sustainability of the investments are of critical importance.

All of the above key thrusts of Sri Lanka’s development framework show vulnerabilities to climate change. Adaptive measures will be necessary to ensure their long term resilience and sustainability in the face of climate change.

In order to effectively bolster Sri Lanka’s national development effort and ensure its success and sustainability, the NCCAS aggregates findings across sectors, and addresses them in an integrated manner which reflects the national priorities articulated through the Mahinda Chintana.
CHAPTER 3

THE STRATEGY

The NCCAS mirrors and supports Sri Lanka’s national development strategy as articulated in the Mahinda Chintana and is aimed at ensuring its success and sustainability.

Accordingly, key findings of sector-based analysis were synthesized into an integrated framework, and structured into the following 5 Strategic Thrusts:

1. **Mainstream Climate Change Adaptation into National Planning and Development**
   - Includes cross cutting policy measures, capacity building, safeguards, monitoring programs, coordination mechanisms, etc.

2. **Enable Climate Resilient and Healthy Human Settlements**
   - Includes housing, urban development and planning, public health, drainage, drinking water, urban wetlands, waste management, pollution control, etc.

3. **Minimize Climate Change Impacts on Food Security**
   - Includes agriculture, fisheries, irrigation, nutrition, etc.

4. **Improve Climate Resilience of Key Economic Drivers**
   - Includes tourism, transport, power, commercial agriculture, etc.

5. **Safeguard Natural Resources and Biodiversity from Climate Change Impacts**
   - Includes water resources management, biodiversity conservation, etc.

Under each of the Strategic Thrusts, key Thematic Areas for action, along with priority Adaptation Measures, have been identified. These are outlined in the following pages.

Detailed information on each recommended Adaptation Measure is in Appendix 2. The overall NCCAS at-a-glance is at the end of this chapter.

A pipeline of projects related to each Strategic Thrust has also been developed as part of the NCCAS, to expedite investment. An index of climate change adaptation projects/concepts seeking financing are in Appendix 3, and the compilation of the relevant concept notes, which were developed by a wide range of stakeholders, is available in a separate volume. Development of additional adaptation project concepts is an ongoing process.
Following the dawn of peace, Sri Lanka has accelerated its multifaceted development drive, which is expected to transform the country in both physical and economic terms within the next decade. Major investments are being rolled out across many sectors, and ambitious targets are being pursued.

The effects of climate change, however, if unaddressed, will likely have impacts on our development drive and the sustainability of our achievements. Such climate change-induced impacts, which we are already beginning to see, cut across multiple sectors. They also often exacerbate problems that the country is already grappling with. For example:

- Increased frequency and intensity of natural hazards such as droughts, floods, and landslides are causing damage to infrastructure, crops, and livelihoods.
- Vector borne diseases are spreading at an alarming rate, while a changing climate creates conditions more conducive for mosquito breeding.
- Our natural resources, which are the underpinning of our society and major industries such as tourism, are under severe stresses due to growing human settlements and anthropogenic activities. These stresses are compounded by climate change impacts.

An integrated approach is needed to mainstream climate change adaptation into national planning and development, and improve the climate resilience of Sri Lanka’s economy and its people. This includes cross-cutting interventions that impact across multiple strategic thrusts and sectors in the economy. Given the scale and significance of potential impacts, climate change adaptation must be considered from the early stages of development planning through the implementation of major projects and programmes. Sri Lanka’s society also needs to have more access to information on climate change related threats they may face, and what they can do at household or community levels to adapt and protect themselves.
Thematic Areas for Action:

A. Strengthen national level climate-adaptation planning and implementation capacity

Climate change adaptation planning capacity is very limited, and scattered. The Climate Change Secretariat (CCS) has a mandate to coordinate climate change related activity across the country. However, CCS capacity to execute on this mandate is constrained on many fronts. Technical capacity to effectively deal with climate change is lacking across key sector agencies as well. There is no focal point or unit responsible for ensuring climate resilience criteria are considered in national level planning initiatives. There are no training institutions or programmes locally which are targeted at building the required technical skill base for effective long term management of climate change risks either. A pool of experts and future leaders in this space needs to be developed and nurtured.

Priority Adaptation Measures:

- i. Strengthen and restructure CCS
- ii. Develop sector specific training programmes on climate change adaptation
- iii. Introduce climate change studies at university level

B. Ensure future investments/economic plans are climate resilient

Climate change considerations are largely not included in planning processes across the economy. While knowledge of the concept of climate change seems widespread, awareness about what can and should be done to adapt is still very limited. Adequate guidelines and safeguards are lacking. The Strategic Environmental Assessment (SEA) and Environmental Impact Assessment (EIA) guidelines, for example, do not specifically include any climate change considerations. Often these are the only environmental checks on major investments – various economic sectors depend on them for guidance on environmental sustainability considerations. Understanding of the economics of climate change in the Sri Lankan context is limited. There seems to be a great deal of ‘fatigue’ among stakeholders in talking about climate change. There is weariness on the limited scope for mitigation action. More focus needs to be placed on adaptation and action, and resource mobilization.

Priority Adaptation Measures:

- i. Incorporate climate change concerns into SEA processes
- ii. Increase awareness of climate change issues across all levels of government.
- iii. Quantify economic costs of climate change on specific sectors

C. Systematically research climate change-adaptation options and disseminate knowledge

While climate change-related initiatives and research are being carried out on an ad-hoc basis by various stakeholders, there is little coordination among them. A range of institutions are coordinating initiatives and research related to climate change (e.g. Department of Meteorology, Disaster Management Center, Universities, NBRO, CCS, NSF, etc.). Access to information and lessons from these various initiatives is limited. An improved and more effective platform for the planning, coordinating, sharing, and disseminating of climate change-related knowledge, which is also clearly linked to national planning activity, is urgently needed.
Priority Adaptation Measures:
   i. Establish coordinated research programme with widespread dissemination
   ii. Model possible future climate scenarios
   iii. Conduct regular national forums on climate impacts on various sectors
   iv. Capture, evaluate and disseminate traditional knowledge on adaptive measures

D. Increase financing for climate change adaptation

Availability of financing for climate adaptation is limited, and a key factor for the fatigue and frustration expressed by many stakeholders participating in climate change initiatives. However, Sri Lanka has an opportunity to capture substantial resources specifically targeted towards climate change being made available internationally. The pursuit of such financing opportunities, however, will require a concerted effort, guided by the Ministry of Finance and supported by cross-sectoral expertise. Institutional mechanisms to effectively allocate, manage, and monitor such financing will also need to be established. Non-government stakeholders and smaller players should also be empowered to access financing and implement climate change adaptation interventions.

Priority Adaptation Measures:
   i. Strengthen NPD/ERD to pursue financing for climate change adaptation
   ii. Establish climate change adaptation small grant facility
   iii. Establish multi-sectoral climate negotiation team for Sri Lanka
   iv. Support climate-change adaptation regulations with incentives, where possible

E. Inform and mobilize stakeholders at multiple levels in support of climate adaptation

The education system, media, and other information ‘multipliers’ are at this point not effectively engaged in disseminating information on climate change. The target groups that need to be mobilized to support climate change adaptation in Sri Lanka are many—ranging from international agencies to local communities. Awareness about technical solutions to climate-induced problems are not available at the local levels, in the local languages and in accessible formats. More effective engagement of civil society organizations is needed, particularly to mobilize for community-level adaptation to climate impacts.

Priority Adaptation Measures:
   i. Effectively engage education system, media, and other information ‘multipliers’
   ii. Make information about adaptation options available at community level
   iii. Promote policy change for climate change adaptation through small group engagement
   iv. Engage existing institutional and community-based mechanisms for coordination
   v. Combat negative anthropogenic activity (such as sand mining)
Sri Lanka is unmistakably on a path of rapid urbanization. Aggressive investments in urban development, housing, and healthcare are core tenets of the national development framework. With immense investments planned in line with the Mahinda Chintana and the NPPP, Sri Lanka is expected to become a predominantly urban country within the next decade, if not sooner.

The MC10YP and MCBF outline a range of investments in human settlements, urban development, drinking water supply, and health infrastructure totaling almost a trillion rupees by 2016. Targets include the development of new metro cities, construction of over 600,000 new housing units, and working towards making Sri Lanka the “Wonder of Asia.”

The effects of climate change, however, are expected to have substantial impacts on our human settlements and our development trajectory. Such impacts, which we are already beginning to see, typically cut across multiple sectors. They also often exacerbate problems that the country is already grappling with.

Climate-related impacts related to the country’s human settlements include:

- Increased frequency and intensity of floods and landslides causing extensive asset loss/damage and displacement of people, particularly the poor.
- Increased frequency and intensity of droughts exerting greater pressure on our freshwater resources, and making drinking water shortages more frequent and severe, particularly in the Dry and Intermediate Zones.
- Increases in ambient temperatures resulting in greater energy (electricity) demand for cooling purposes.
- Increases in vector densities due to climatic factors, resulting in the rapid spread of diseases such as dengue, particularly in urban areas.
- Gradual sea level rise and associated effects causing long-term damage to coastal settlements, infrastructure, and livelihoods.
An integrated approach is needed to enable the development of climate resilient and healthy human settlements to ensure Sri Lanka’s national interests are not jeopardized by current and potential climate change-induced risks. The range of cross-cutting issues will require interventions spanning across planning, housing, water supply and drainage, health, roads, and several other sectors.

**Thematic Areas for Action:**

**A. Mobilize stakeholders for climate change adaptation of settlements**

Various mechanisms for community and household level adaptation to climate change--such as improved construction methods already developed--are not widely in use. This is partly due to poor mobilization of stakeholders on the ground. Sri Lanka has existing institutional mechanisms (such as District Coordinating Committees and local government) which are geared towards ensuring engagement of the local level. However, their engagement in mobilizing stakeholders towards climate change adaptation has not been initiated. The same applies to the extensive grassroots networks of the NGO sector. Systematic and targeted approach to mobilize stakeholders for multi-sectoral adaptation initiatives is needed. Effective regulations and/or incentives to promote adaptation in settlements are lacking.

**Priority Adaptation Measures:**

1. Establish coordination body/mechanism for climate change adaptation of settlements
2. Promote improved climate resilient construction methods
3. Support climate change adaptation interventions with incentives

**B. Improve planning to include climate change considerations**

Human settlement planning in the Sri Lankan context largely ignores climate change related concerns such as the increased frequency/intensity of natural hazards, changes in rainfall patterns, temperature rise, and sea level rise. This is in part due to a lack of information on possible risks and impacts. While development plans are formulated for the major urban areas in the country, such planning initiatives do not cover areas currently beyond UDA’s purview. Inadequacy of land planning is leading to haphazard and sprawling development patterns, degradation of environmental conditions, and increases in the climate change vulnerability of human settlements.

**Priority Adaptation Measures:**

1. Develop detailed local-level hazard maps for key settlements
2. Stimulate greening of settlements and preservation of natural ecosystems
3. Promote land use planning and monitoring for both urban and rural areas
4. Research climate change impacts on human settlements and link to planning

**C. Ensure adequate quality and quantity of water for settlements**

As human settlements rapidly expand, the pressure to ensure adequate quality and quantity of water to fulfill the demand for domestic (and industrial) use also increases. This pressure is exacerbated by the impacts of climate change. Sri Lanka currently has poor management of watersheds and water sources. Principles of IWRM are rarely implemented. Contamination of water sources is a common problem. Awareness and technical
knowledge to conserve water and control pollution is limited. While several agencies carry out water quality monitoring and surveillance, it is inadequate and not carried out in a systematic and coordinated manner. Data sharing among key stakeholders is lacking. The use of water saving methods and rainwater harvesting are also limited.

Priority Adaptation Measures:

i. Promote water saving technologies including rainwater harvesting
ii. Improve monitoring/surveillance and sharing of data across sectors
iii. Promote integrated water resources and watershed management
iv. Research climate impacts on water availability and develop scalable adaptation models

D. Combat climate change-related health concerns in settlements

Climate change-related health concerns in the Sri Lankan context are not fully understood, although clear links between changing climate and the rapid spread of mosquito, rodent, and water-borne diseases, as well as respiratory diseases, are widely acknowledged. The spread of such climate change-linked communicable diseases is exacerbated due to haphazard development patterns and the associated degradation of environmental conditions. While the health sector collects extensive data to monitor and control health concerns, data collected by MOH area is incongruent with the divisional secretariat boundaries used by most other sectors, making cross-sectoral analysis and cooperation difficult.

Priority Adaptation Measures:

i. Monitor and control vector borne diseases
ii. Facilitate data sharing and compatibility between Ministry of Health and other sectors
iii. Engage health sector experts in local level planning
iv. Research health impacts of climate change in Sri Lankan context

E. Increase awareness on vulnerabilities and adaptation of settlements

Awareness levels about the impacts of climate change on human settlements are limited among the public, technical service providers, as well as government agencies. Research in this area is limited, and dissemination of findings is lacking. Media engagement or targeted messaging aimed at increasing the resilience of human settlements to climate change is largely absent and inter-sectoral coordination is lacking as well.

Priority Adaptation Measures:

i. Improve the gathering, processing and dissemination of information related to human settlements
ii. Enhance awareness and demand for climate resilient construction
iii. Improve coordination/dissemination through existing institutional mechanisms
iv. Engage media more proactively with messaging tailored for stakeholders
Ensuring food security is the core principle behind development of the agriculture, fisheries and irrigation sectors in Sri Lanka’s national development agenda. This thrust is further bolstered by the emphasis on nutrition in the health sector. Our national development drive seeks to substantially increase agricultural productivity, increase fisheries yields, and decrease malnourishment. The MC10YP stipulates investments of over Rs. 360 billion during the plan period in non-plantation agricultural productivity enhancements and irrigation alone.

However, climate change impacts may substantially hamper our development aims and performance in this Strategic Thrust. For example:

- Increasing demands on our freshwater resources due to expanding settlements, combined with impacts of droughts and saline intrusion in the coastal areas, will reduce water availability for both agriculture and household use.
- Variability and unpredictability of rainfall regimes impact the reliability of agricultural yields, particularly for crops with specific growing seasons, such as rice.
- Droughts and increased soil erosion will reduce storage capacity in irrigation tanks and canals, which are already low in maintenance.

An integrated approach is needed to minimize the climate change impacts on food security involving irrigation, agriculture, fisheries, nutrition (health) and environment sectors as part of the initiative to ensure Sri Lanka’s national interests are adapted to be resilient to potential climate change-induced risks.
Thematic Areas for Action:

A. Ensure ability to meet food production and nutrition demand

Fluctuations in agricultural, livestock, and fisheries production volumes and pricing can be expected as a result of climate change impacts. The irregularity of rainfall patterns, for example, is a major problem particularly for paddy cultivation, requiring the rapid distribution of seed stock of specific varieties depending on the onset of monsoon rains. Yield loss due to drought, flood, and salinity are increasing due to climate change. The impact of climate change on pest populations is not clearly understood. Neither are the impacts of climate change on the livestock and fisheries sectors. Fluctuations in production will inevitably manifest in pricing variations that will make it even more difficult for vulnerable populations to meet their nutritional needs. Crop diversification may be required.

Priority Adaptation Measures:

i. Increase awareness on alternative options to meet nutrition requirements
ii. Improve weather forecasting and information dissemination
iii. Ensure easy access to seed stock alternatives to counter rainfall variability
iv. Research climate impacts/adaptive measures for agriculture, livestock and fisheries sectors
v. Conserve genetic resources for future crop and livestock improvement

B. Ensure adequate water availability for agriculture

Ensuring adequate water availability for agriculture despite climate change is a key challenge in ensuring food security. Increased frequency and severity of droughts, combined with increased soil erosion and siltation due to high intensity rains, could limit ground and surface water capacity. Sea level rise is increasing the threat of saline intrusion, and the situation is exacerbated by sand mining in rivers. The irregularity of rainfall patterns is a major problem particularly for paddy cultivation. Sri Lanka’s ancient tank systems are not optimally utilized. Integrated management of water resources is generally not practiced and forest cover in catchments is diminishing. While water saving farming practices and crops have been identified, their use is limited.

Priority Adaptation Measures:

i. Promote water-efficient farming methods and crops to improve water productivity
ii. Improve maintenance of existing tanks and reservoirs including their watersheds and catchments
iii. Adopt and promote the principles of IWRM
iv. Construct new reservoirs and trans-basin diversions to meet demand

C. Mitigate food security-related socio-economic impacts

Over the medium to long term, climate change may impact the competitiveness of Sri Lanka as a producer of certain products in agriculture, while giving it competitive advantages in others. The impact of probable scenarios on entire value chains is not clearly understood. A clear understanding of the scale of socio-economic impacts is also lacking. For example, communities dependent on the marine fisheries industry may be impacted by threats to their settlements and landing sites due to erosion and sea level rise. Other
vulnerable groups throughout the country may be similarly at risk. Initiatives to minimize socio-economic impacts of climate change through diversification or risk transfer are limited.

**Priority Adaptation Measures:**

i. Encourage risk transfer methods such as insurance  
ii. Research climate impacts on long-term food security and agriculture value chains  
iii. Identify and help vulnerable fishing communities to adapt or relocate

**D. Increase awareness and mobilize communities for climate change adaptation**

Communities dependent on agriculture are already feeling the impacts of climate change, but awareness about how to adapt at a community or household level is lacking. Some potential adaptation options for the agriculture sector have been studied, but have not been scaled up. Existing field level coordination mechanisms and the extensive grassroots networks of the NGO sector are not effectively engaged or mobilized to support climate change adaptation.

**Priority Adaptation Measures:**

i. Increase awareness on climate impacts on food security and on the potential adaptive measures  
ii. Pilot test and scale up community level agriculture/livestock/fisheries adaptation models  
iii. Improve utilization of field level coordination mechanisms and civil society organizations  
iv. Promote risk transfer initiatives
The MC10YP and MCBF stipulate aggressive investments in much needed economic infrastructure, including transport, power, housing, etc. It has also initiated major initiatives to substantially expand and capture the potential of industries such as tourism and shipping. The total investment stipulated between 2007 and 2016 (the plan period) is over Rs. 1.4 trillion (accounts for over a third of total investments in the MC10YP). A major transformation of the country in both physical and economic terms is widely anticipated as a result of these investments.

While these major investments are being rolled out, adequate consideration of potential climate change induced risks is critical to ensure that our investments and economic growth are sustainable over the long term. Some investments and sectors may be substantially vulnerable to climate change. For example:

- Sea level rise, storm surges and continued coastal erosion will have negative impacts on our coastal infrastructure. Some of our most critical transport infrastructure runs through coastal areas, and are already being impacted by erosion.
- Sri Lanka’s tourism industry is underpinned by its natural resources, including beaches and biodiversity, which could be negatively impacted by climate change impacts such as temperature rise, sea level rise, and increased natural hazards.
- Frequent floods and landslides are already causing extensive damage to our infrastructure in regions prone to natural hazards. The impacts will get worse with the increase in frequency and intensity of these hazards due to climate change.

An integrated approach is needed to improve the climate resilience of key economic drivers involving tourism, transport, commercial agriculture and several other sectors to minimize risks to Sri Lanka’s development trajectory.
Thematic Areas for Action:

A. Minimize impacts of climate change on infrastructure

Most infrastructure constructed in Sri Lanka to date, including roads, drainage systems, railways, etc. have not factored in climate change considerations. While in some areas it may not matter, in others this is critical. For example, transport infrastructure in certain coastal areas could be under severe threat due to sea level rise. A systematic investment program to adapt infrastructure prone to climate change risks is not available. This will necessarily have to follow after a detailed study, but the investments involved could be substantial. Sectors such as tourism are also under threat, as our beaches and biodiversity which underpin our tourism product are both at risk due to climate change. At a broader level, guidelines and standards for development and engineering of infrastructure currently in use are outdated and do not include climate change risk considerations—thus posing a substantial threat to the sustainability of ongoing investments.

Priority Adaptation Measures:

i. Identify climate change risks on transport infrastructure, and invest in adaptive measures
ii. Update standards/guidelines for infrastructure design and development
iii. Include climate change adaptations in tourism planning guidelines

B. Minimize impacts of climate change on plantation sector

Climate impacts on the major plantation crops such as tea, rubber and coconut are being studied, but awareness on how climate change will impact the various crops is limited particularly among field level stakeholders. Clear plans are not available for scaleable adaptive measures and how and where to deploy them. Climate change may present opportunities as well as threats. Potential opportunities have not been explored. A systematic body of research aimed at ensuring the climate change resilience of Sri Lanka’s key plantation industries needs to be pursued.

Priority Adaptation Measures:

i. Research climate impacts and adaptive measures in plantation sub-sectors
ii. Pilot test and scale-up sub-sector specific adaptation measures
iii. Evaluate and exploit potential productivity benefits due to climate change

C. Assist key industries in coping with climate change impacts

A lack of information, coordination, guidance and safeguards inhibit the ability to ensure investments in industries are resilient to climate change. A more comprehensive assessment of climate change impacts on our key industries is needed. Such information needs to be easily accessible to investors, as well as planners and regulators. Community level awareness of potential climate impacts on industries, and how they may adapt is also limited. Energy saving methods and the use of renewable energy sources although recognized as desirable, could be promoted more aggressively as well.
Priority Adaptation Measures:

i. Make sector-specific climate vulnerability information available to investors/regulators
ii. Encourage climate change risk transfer options for key industries
iii. Research potential climate change impacts/adaptive measures for key industries
iv. Offer incentives for industrial energy saving practices and renewable energy usage

D. Raise awareness about climate vulnerability in key economic sectors

Climate change awareness in key economic sectors is currently low and vague. The capacity within sectors/industries to address climate change concerns is also extremely limited. A sustained and broad-based dialogue to improve awareness, and to mobilize stakeholders within vulnerable industries (such as tourism and plantations) for climate change adaptation is needed. This calls for raising the awareness and understanding of climate vulnerabilities, adaptation options and costs. A balanced and constructive approach is needed.

Priority Adaptation Measures:

i. Increase climate change awareness at all levels
ii. Build capacity for climate change adaptation in key economic sectors
iii. Engage wider stakeholders in dialogue on climate adaptation
Land and water are among Sri Lanka’s most important natural resources, which together with the island’s exceptional biodiversity underpin food security, livelihoods, nutrition and health of the population as well as economic development. This is particularly evident in the fields of agriculture and livestock production, fisheries, forestry, tourism, traditional medicine, most manufacturing industries, and external trade. Sri Lanka’s high biodiversity includes a diverse array of ecosystems and species, and provides for a wide range of ecosystem services, such as providing fresh water, ameliorating the climate, containing soil erosion, regulating surface runoff and providing bio-resources. Not surprisingly, the importance of the country’s natural resources and biodiversity are recognized in key national planning documents and policies, and over-arching policies and plans that govern environmental management.

The potential climate change vulnerabilities of natural resources and biodiversity include:

- Land degradation due to extreme weather events, natural hazards, and soil erosion that causes loss of soil fertility and agricultural productivity.
- Changes in water quality and quantity in inland freshwaters.
- Degradation of vegetation in watersheds due to climate change.
- Changes in terrestrial, inland wetland and coastal systems, their species and ecosystem services, due to changes in rainfall regimes and rising temperatures.
- Changes in growth rates, reproduction and geographic ranges of species and phenology of plants due to climatic changes.
- Changes in coastal and marine systems, species and ecosystem services due to sea level rise, global warming and ocean acidification, with particular impacts on coral reefs and associated species.
All climate change impacts on biodiversity may not be preventable. However, guidelines provided by the Secretariat to the Convention on Biological Diversity suggest that timely identification of threats, concerted conservation action to increase and maintain the resilience of species and ecosystems, availability of connected and safe protected areas and conducive refugia for affected species, and the use of an integrated ecosystem approach are practical and effective climate change adaptation strategies.

**Thematic Areas for action:**

**A. Ensure adequate quality and quantity of water for human wellbeing and ecosystem services**

Sri Lanka, though not a water scarce country, needs to manage its resources effectively to ensure future water security and related ecosystem services in view of climate change. Already, the availability of both ground and surface waters for human needs and ecosystem services is reduced due to declining water quality in all climatic zones, and declining water quantity in the dry and intermediate zones. There is an urgent need to strengthen and centralize the management of water resources in the country with a strong water policy to minimize current confusion on responsibilities in water management. Thereafter, an effective water quality monitoring system, national level IWRM plans to address multiple users and environmental flows, and mechanisms to identify, protection and manage watersheds that lie outside protected areas, have to be initiated.

**Priority Adaptation Measures:**

i. Promote efficient water resource use and development using IWRM

ii. Promote research partnerships on good practices for varied water uses

iii. Strengthen/establish an institution to coordinate management of water resources

**B. Enhance climate change resilience of terrestrial ecosystems and their services**

Habitat loss, fragmentation and degradation due to decreased canopy cover and forest conversion to other uses are major anthropogenic threats that undermine and erode terrestrial biodiversity. Resilience of forests and other key terrestrial habitats, as well as the species they contain, need to be enhanced in all climatic zones. The ecosystem approach provides an effective framework for integrated management with the participation of key stakeholders. Special attention should be given to areas with already threatened, endemic, or otherwise important species with high vulnerability to climate change.

**Priority Adaptation Measures:**

i. Link/restore/conserve, forests and other habitat refugia to increase resilience of ecosystems and species

ii. Convert monoculture forest plantations into mixed species plantations

iii. Promote land use planning for biodiversity conservation and limit inappropriate vegetation conversion

iv. Establish and/or effectively manage Protected Areas and other important wildlife refuges in all climatic zones
C. Enhance the resilience of coastal and marine ecosystems and associated vulnerable species

Many coastal ecosystems are degraded due to poor land use, coastal erosion, pollution and over-exploitation of resources. With increasing temperature and changing weather patterns coastal ecosystems will inevitably face changes in their physical, chemical and biological functions. Anthropogenic stresses that degrade these systems further need to be minimized. New Special Area Management (SAM) sites should be identified and plans developed. Already existing SAM plans should be effectively implemented encouraging the adoption of the integrated coastal zone management approach. Sustainable use of coastal resources should be promoted at community level.

Priority Adaptation Measures:

i. Promote integrated coastal resource management, particularly at SAM sites
ii. Restore and rehabilitate degraded coastal ecosystems and depleted coastal species

D. Enhance climate change resilience of natural inland wetlands and associated species.

Inland wetlands are rich in species and are the source of water for domestic, agriculture and inland fishery related needs. They are often degraded or lost due to multiple anthropogenic threats. The loss of wetlands in urban areas that are important as flood retention areas and habitats for urban biodiversity has resulted in major urban floods in recent years. Pollution of inland wetlands has led to substantial ecosystem and biodiversity degradation. Inland wetlands need to be protected to ensure uninterrupted ecosystem services that sustain us. Special attention needs to placed on coastal freshwater wetlands and biodiversity that face high risk of salt water intrusion due to over-extraction, inland sand mining, and sea level rise.

Priority Adaptation Measures:

i. Protect marshes/flood retention areas in urban areas and limit land conversion.
ii. Prevent the discharge of industrial effluents and solid waste into inland wetlands
iii. Control and manage salt water intrusion into coastal freshwater wetlands
iv. Strengthen coordination and streamline management of wetlands across relevant agencies

E. Address socioeconomic concerns resulting from climate change impacts on biodiversity

Biodiversity based livelihoods and communities are bound to be adversely affected by climate change. Sea level rise, for example, will impact fishery processes, livelihoods, and life styles of coastal communities. Unplanned forest clearing in the dry zone has resulted in drastic changes in food habits and migration routes of animals such as elephants, which in turn have increased human-animal conflicts. Adapting in such situations requires skill building to adjust to changes in bio-resources, shifting to alternate means of livelihood, or sometimes relocating to safer places.

Priority Adaptation Measures:

i. Identify and address climate change impacts on biodiversity that affect local communities
ii. Help communities to adapt to changes in livelihoods or to relocate when necessary
F. Research, monitor and address impacts of climate change on biodiversity

Extensive research is needed to better understand climate change impacts on the natural resources and biodiversity of Sri Lanka. Research and monitoring activities addressing a wide range of ecosystems, their species and their interactions need to be studied, understood and potential adaptive interventions identified. Research and monitoring of Invasive Alien Species and other potential threats should be strengthened to help develop effective interventions in controlling them. The use of traditional knowledge in conservation should also be explored.

Priority Adaptation Measures:

i. Research and monitoring programs to strengthen knowledge base on climate change and terrestrial biodiversity
ii. Research and monitoring programs to strengthen knowledge base on climate change and aquatic biodiversity
iii. Minimize entry, establishment and spread of invasive alien species (IAS)

G. Raise awareness and mobilize stakeholders for conservation of biodiversity and ecosystem services

Rising awareness on the importance of natural resources and biodiversity is crucial in effectively protecting and conserving them. Educating all stakeholders on the current problems, how they are expected to worsen with climate change, and how they can help is essential in resolving long-standing problems in ecosystem conservation. While public awareness has risen on conserving species and ecosystems, there is still limited understanding of the newer concepts of ecosystem services. Enhancing this knowledge would help in promoting integrated, ecosystems-based approaches to climate adaptation.

Priority Adaptation Measures:

i. Focus on minimizing current stresses on ecosystems
ii. Promote training and awareness on use of the ecosystem approach for conservation
iii. Build capacity for climate adaptation research among students and staff of conservation agencies
iv. Increase public awareness about the value of aquatic and marine ecosystems
v. Engage in dialogue with wider stakeholders
The NCCAS at a Glance

Strategic Thrust 1: Mainstream CC Adaptation into National Planning and Development

A Strengthening national climate-adaptation planning and implementation capacity
   i Strengthen and restructure CCS
   ii Develop of sector specific training programmes on CC adaptation measures
   iii Introduce climate change studies at university level

B Ensure future investments/economic plans are climate resilient
   i Incorporate CC concerns into SEA processes
   ii Increase knowledge and understanding of CC among planners and senior technical staff
   iii Quantify economic costs of CC on specific sectors

C Systematically research climate change-adaptation options and disseminate knowledge
   i Establish coordinated multidisciplinary research programme with widespread dissemination
   ii Model possible future climate scenarios
   iii Conduct regular national forums on climate impacts on various sectors
   iv Capture, evaluate and disseminate traditional knowledge on adaptive measures

D Increase financing for CC adaptation
   i Strengthen NPD/ERD to pursue financing for climate change adaptation
   ii Establish CC adaptation small grant facility
   iii Establish a multi-sectoral climate negotiation team for Sri Lanka
   iv Support CC adaptation regulations with incentives, wherever possible

E Inform and mobilize stakeholders at multiple levels in support of climate adaptation
   i Effectively engage education system, media and other information ‘multipliers’
   ii Make information about adaption options available at community level
   iii Promote policy change for CC adaptation through small group engagement
   iv Engage existing institutional and community-based mechanisms for coordination of adaptation activities
   v Combat negative anthropogenic activity (such as sand mining)

Strategic Thrust 2: Enable Climate Resilient and Healthy Human Settlements

A Mobilize stakeholders for CC adaptation of settlements
   i Establish coordination body/mechanism for CC adaptation of settlements
   ii Promote improved climate resilient construction methods
   iii Support CC adaptation interventions with incentives

B Improve planning to include CC considerations
   i Develop detailed local-level hazard maps for key settlements
   ii Upgrade drainage in key settlements
   iii Stimulate greening and increase of canopy cover in settlements and preserve natural ecosystems
   iv Research CC impacts on human settlements and link to planning

C Ensure adequate quality and quantity of water for settlements
   i Promote water saving technologies including rainwater harvesting
   ii Improve monitoring/surveillance and sharing of data across sectors
   iii Promote integrated water resources and watershed management
   iv Research climate impacts on water availability and develop scalable adaptation models

D Combat climate change-related health concerns in settlements
   i Monitor and control vector borne diseases
   ii Facilitate data sharing and compatibility between Ministry of Health and other sectors
   iii Engage health sector experts in local level planning
   iv Research health impacts of CC in Sri Lankan context

E Increase awareness on vulnerabilities and adaptation of settlements
   i Improve the gathering, processing and dissemination of information related to human settlements
   ii Enhance awareness and demand for climate resilient construction
   iii Improve coordination/dissemination through existing institutional mechanisms
   iv Engage media more proactively with messaging tailored for stakeholders

Strategic Thrust 3: Minimize CC Impacts on Food Security

A Ensure ability to meet food production and nutrition demand
   i Promote alternative options to meet nutrition requirements
   ii Improve weather forecasting and information dissemination
   iii Ensure easy access to seedstock alternatives/advice to counter rainfall variability
   iv Research climate impacts/adaptive measures for agriculture, livestock and fisheries sectors
   v Conserve genetic resources for future crop and livestock improvement

B Ensure adequate water availability for agriculture
   i Promote water-efficient farming methods and crops
   ii Improve maintenance of existing tanks and reservoirs including their watersheds and catchments
iii Adopt and promote the principles of IWRM
iv Construct new reservoirs and trans-basin diversions to meet demand

C Mitigate food security-related socioeconomic impacts
i Encourage development of risk transfer methods
ii Research climate impacts on long-term food security and agriculture value chains
iii Identify and help vulnerable fishing communities to adapt or relocate

D Increase awareness and mobilize communities for CC adaptation
i Increase awareness on climate impacts on food security and on the potential adaptive measures.
ii Pilot test and scale up community level agriculture/livestock/fisheries adaptation models
iii Improve utilization of field level coordination mechanisms and civil society organizations
iv Promote risk transfer initiatives

Strategic Thrust 4: Improve Climate Resilience of Key Economic Drivers

A Minimize impacts of CC on infrastructure
i Identify CC risks on transport infrastructure, and invest in adaptive measures
ii Update standards/guidelines for infrastructure design and development
iii Include CC adaptations in tourism planning guidelines

B Minimize impacts of CC on plantation sector
i Research climate impacts and adaptive measures in plantation sub-sectors
ii Pilot test and scale-up sub-sector specific adaptation measures
iii Evaluate and exploit potential productivity benefits due to CC

C Assist key industries in coping with CC impacts
i Make sector-specific climate vulnerability information available to investors/regulator
ii Encourage CC risk transfer options for key industries
iii Research potential CC impacts/adaptive measures for key industries
iv Offer incentives for industrial energy saving practices and renewable energy usage

D Raise awareness about climate vulnerability in key economic sectors
i Increase CC awareness at all levels
ii Build capacity for CC adaptation in key economic sectors
iii Engage wider stakeholders in dialogue on climate adaptation

Strategic Thrust 5: Safeguard Natural Resources and Biodiversity from CC Impacts

A Ensure adequate quality and quantity of water for human wellbeing and ecosystem services
i Promote efficient water resource use and development using IWRM
ii Promote research partnerships on good practices for varied water uses
iii Strengthen/establish an institution to coordinate management of water resources

B Enhance CC resilience of terrestrial ecosystems and their services
i Link/restore/conserve, forests and other habitat refugia to increase resilience of ecosystems and species
ii Convert monoculture forest plantations into mixed species plantations
iii Promote land use planning for biodiversity conservation and limit inappropriate vegetation conversion
iv Establish and/or effectively manage PAs and other important wildlife refuges in all climatic zones

C Enhance the resilience of coastal and marine ecosystems and associated vulnerable species
i Promote integrated coastal resource management, particularly at SAM sites
ii Restore and rehabilitate degraded coastal ecosystems and depleted coastal species

D Enhance CC resilience of natural inland wetlands and associated species
i Protect marshes/flood retention areas in urban areas and limit land conversion.
ii Prevent discharge of industrial effluents and solid waste into inland wetlands
iii Control and manage salt water intrusion into coastal freshwater wetlands
iv Strengthen coordination and streamline management of wetlands across relevant agencies

E Address socioeconomic concerns resulting from CC impacts on biodiversity
i Identify and address CC impacts on biodiversity that affect local communities
ii Help communities to adapt to changes in livelihoods or to relocate when necessary

F Research, monitor and address impacts of CC on biodiversity
i Research and monitoring programs to strengthen knowledge base on CC and terrestrial biodiversity
ii Research and monitoring programs to strengthen knowledge base on CC and aquatic biodiversity
iii Minimize entry, establishment and spread of IAS

G Raise awareness & mobilize stakeholders for conservation of biodiversity and ecosystem svcs.
 i Focus on minimizing current stresses on ecosystems
ii Promote training and awareness on use of the ecosystem approach for conservation
iii Build capacity for climate adaptation research among students and staff of conservation agencies
iv. Increase public awareness about the value of aquatic and marine ecosystems
v Engage in dialogue with wider stakeholders
CHAPTER 4

FINANCING REQUIREMENTS AND IMPLEMENTATION TARGETS

The NCCAS lays out a framework for action for the 2011-2016 period, with the aim of moving Sri Lanka towards a bright and climate change resilient future.

Adaptation to climate change requires concerted action from many corners of Sri Lankan society including politicians and leaders, government agencies, NGOs, researchers, academia, the private sector, as well as communities and households. The NCCAS is expected to lay a broad framework for coordinating and mobilizing this range of stakeholders around a prioritized framework of action.

An estimated 47.7 billion rupees in incremental additional financing, beyond current and ongoing expenditure, will be required to implement the NCCAS over its 6 year duration. This resource pool, which needs to be raised and mobilized, is expected to include investments from Government, international development partners, NGOs, as well as the private sector.

<table>

<tr>
<td>Total</td>
</tr>
</tbody>
</table>

The vast majority of these financial resources are expected to be channeled directly to the broad base of agencies and stakeholders (both within Government and beyond), to finance and implement climate change adaptation interventions of varied scale. Such interventions would range from discrete stand-alone projects aimed at climate change adaptation, to add-ons to ongoing projects to bolster their climate resilience. The Ministry of Environment will play a facilitation and coordination role in the process.

Further detail on the estimated financing required is in Appendix 4. A target schedule for implementation of the range of activities in the NCCAS is in Appendix 5.

A pipeline of climate change adaptation projects in line with the NCCAS has been developed to expedite the mobilization of investment. The proposed project concepts seeking financing are listed in Appendix 3 and the compilation of the relevant concept notes, which were developed by a wide range of stakeholders, is available in a separate volume at the Climate Change Secretariat in the Ministry of Environment. Development of additional adaptation project concepts is an ongoing process.
APPENDICES
APPENDIX 1

List of Key Persons/Institutions Consulted

Government Organizations (GOs)

Abayawardana, S. Director/CEO, National Science Foundation (NSF)
Abeyratne, D L P R. Senior Assistant Secretary, Ministry of Tourism
Abeyesinghe, I S. Director, Tea Research Institute (TRI)
Abheyrathne, D M. Director/Planning, Ministry of Irrigation & Water Management
Alawathugoda, D. Research Officer, Forest Department
Amarasinghe, A. Head- ILD, National Science Foundation (NSF)
Amarawardena, G K D. Additional Secretary, Ministry of Disaster Management and Human Rights
Balanadan, S. Technical officer, Water Resources Board
Balasingham, S. Registrar-Community Medicine, Ministry of Health
Banda, J. Team Leader- Education, Training & Awareness (SNC)
Bandara, R M S. Head-Landslide Studies and Services Division, National Building Research Organization (NBRO)
Bandarathillake, H M. National Project Manager, SNC Project team
Batuwitage, L P. Additional Secretary, Ministry of Environment
Chandradasa, U W L. Director-Tech & Mitigation, Disaster Management Centre, Ministry of Disaster Mgt. & Human Rights
Chandrapala, L. Director, National council for Disaster Management (MDM)
De Costa, H. EMO/ Biodiversity Secretariat, Ministry of Environment
De Silva, S.B.A. Road Development Authority
de Zoysa, I J. Director General, Department of Agriculture
Dharmakeerthi, S. Assistant Director/CCS, Ministry of Environment
Dissanayake, D M T K. Actg. Assistant Director, Central Environmental Authority (CEA)
Dissanayake, K M D P. Senior Engineer, Coast Conservation Department
Dr. Silva, D A C. CEO, Sri Lanka Institute of Tourism and Hotel Management (SLITHM)
Dr. Wijeratne, PM. Deputy Director, Plant Genetic Resources Centre (PGRC)
Fernando, M P S. Conservator General of Forest, Forest Department
Fernando, P J D. Assistant Director, Ministry of Housing and Common Amenities
Fernando, S. EMO, Ministry of Health
Gamage, G. Director/Biodiversity Secretariat, Ministry of Environment
Gamage, M. Director General, Dept. of For. Aid & Budget Mon., Min. of Fin. & Plan.
Gamage, M. Hydrogeologist, Water Resources Board
Gunasekera, H M. Director General – NPD, Ministry of Finance and Planning
Gunasinghe, K G S D. Sri Lanka Institute of Tourism and Hotel Management (SLITHM)
Gunasinghe, W A D S. Director - Public Utility, Ministry of Finance and Planning
Gunawardene, G M J K. Director/ Promotion & Education, Ministry of Environment
Gunawardene, J. Environment Lawyer, Central Environmental Authority (CEA)
Hapuarachchi, L. EMO/Biodiversity Secretariat, Ministry of Environment
Haputhanthri, S. Head/MMRD, National Aquatic Resources Research and Development Agency (NARA)
Herath, A. Assistant Director/CCS, Ministry of Environment
Herath, H D B. Coordinator-Disaster Management, Ministry of Health
Hettiarchchhi, D K. Sri Lanka Tourism Development Authority (SLTDA)
Hettiarchchhi, G. Director General, Disaster Management Centre, Ministry of Disaster Mgt. & Human Rights
Hewapathirana, K. Fishery Biologist, Department of Fisheries and Aquatic Resources
Inoka, T. EMO/CCS, Ministry of Environment
Iqbal, M C M. Team Leader – Vulnerability and Adaptation (SNC)
Jagoda, D. Senior Architect, National Housing Development Authority (NHDA)
Jayasekera, S R. Deputy Director, Ministry of Disaster Management and Human Rights
Jayasinghe, G. Director/Envt. Mgt and Assessment, Central Environmental Authority (CEA)
Jayasooriya, B. Ministry of Fisheries & Aquatic Resources
Jayasundara, S. PA/Biodiversity Secretariat, Ministry of Environment
Jayathillaka, M A R D. Former Secretary, Ministry of Environment
Jayathillake, A. Director/ Air Resources Management & International Relations, Ministry of Environment
Jayathunga, S. Director/Sustainable Development, Ministry of Environment
Jayatissa, R. Head-Dep. of Nutrition, Medical Research Institute (MRI)
Jayaweera, D S. Director General – Development Finance, Ministry of Finance and Planning
Kalaiselvam, S. Director General, Sri Lanka Tourism Development Authority (SLTDA)
Kannangara, J A A N. SAS, Ministry of Housing and Common Amenities
Kariyawasam, S H. Director, Ministry of Disaster Management and Human Rights
Kariyawasam, S. Actg. SAS, Water Resources Board
Karunaratne, N. Ministry of Environment
Kasturiarchchhi, K. EMO/CCS, Ministry of Environment
Kariyawasam, S. Actg. SAS, Water Resources Board
Kariyawasam, S H. Director, Ministry of Disaster Management and Human Rights
Kariyawasam, S. Actg. SAS, Water Resources Board
Kariyawasam, S H. Director, Ministry of Disaster Management and Human Rights
Kariyawasam, S. Actg. SAS, Water Resources Board
Kariyawasam, S. Actg. SAS, Water Resources Board
Karunaratne, N. Ministry of Environment
Kasturiarchchhi, K. EMO/CCS, Ministry of Environment
Kiriella, M B. Director International Relations & Research, Sri Lanka Tourism Development Authority (SLTDA)
Kotinkaduwa, J D. Assistant Director, Ministry of Finance and Planning
Kulathunga, A A. Director/NRM, Ministry of Environment
Kumara, P. Asst. Gen. Manager, Water Resources Board
Kurukulasuriya, V. Director/Research, National Physical Planning Department (NPPD)
Lekamge, S. Director – Primary Education, National Institute of Education (NIE)
Maheepala, P G. Dep. DG, Ministry of Health
Mallawaarachchi, U N. Assistant Director Planning, Ministry of Transport
Manorathne, R W S M N. Assistant Director, Central Environmental Authority (CEA)
Musthapha, F, Hon. Deputy Minister, Ministry of Environment
Narampanawa, W M V. Additional Secretary, Ministry of Environment
Niranjan, K. Engineer, Ceylon Electricity Board
Nissanka, S. P. Head, Clean Development Mechanism Centre, CDM Centre
Pathirana, U P L D. Director/ Administration, Ministry of Environment
Pathirana, N C. Director, Ministry of Health
Pathirana, S. EMO/CCS, Ministry of Environment
Perera, D. EMO/ Biodiversity Secretariat, Ministry of Environment
Perera, H N R. Acting Project Director, Coast Conservation Department
Perera, H S. Lab Technician, Coconut Development Authority
Perera, K D S R. Director – NPD, Ministry of Finance and Planning
Perera, N. Director, Central Environmental Authority (CEA)
Perera, N. Team Leader- GHG Inventory (SNC)
Perera, S. Director/ERD, Ministry of Finance and Planning
Perera, W. Assistant Director General, National Institute of Education (NIE)
Premalal, K H S M. Deputy Director, Department of Meteorology
Priyalal, N C. Agriculture Development Assistant, Ministry of Agriculture
Priyantha, K M H G S. Vet Surgeon, Department of Animal Production and Health (DAPH)
Priyanthie, S. EMO/P &P, Ministry of Environment
Prof. Wijesinha, R. Secretary, Ministry of Disaster Management and Human Rights
Punyawardane, B U R. Head – Climate Change Division, Department of Agriculture
Rajasuriya, A. Research Officer, National Aquatic Resources Research and Development Agency (NARA)
Rajkumar, S G J. Assistant General Manager, National Water supply and Drainage Board (NWSDB)
Ranasinghe, A. SO/NSF, National Science Foundation (NSF)
Ranasinghe, H. Team Leader- Mitigation (SNC)
Ranasinghe, I. Director General (Development), Ministry of Fisheries & Aquatic Resources
Ranawaka, R A S. Senior Engineer (Development), Coast Conservation Department
Ranawake, P C. Former Hon. Minister, Ministry of Environment
Ranaweerarachchi, C. Director/Sustainable Development, Ministry of Environment
Ranbanda, J M. Nutrition Assistant, Medical Research Institute (MRI)
Randeni, L. EMO/Promotion & Education, Ministry of Environment
Rathna, D. RA/CCS, Ministry of Environment
Rathnayake, R M J C. D/A, National Physical Planning Department (NPPD)
Rathnayake, S. EMO/ Biodiversity Secretariat, Ministry of Environment
Ratnayake, P U. Director, Sri Lanka Tourism Development Authority (SLTDA)
Ravindralingam, K. Senior Engineer, Road Development Authority
Samansiri, S. Ass. Director IT/GIS, Disaster Management Centre, Ministry of Disaster Mgt. & Human Rights
Samaranayake, J W K. Plant Genetic Resources Centre (PGRC)
Samaranayake, U M M. Director-Nutrition, Ministry of Health
Samarappuli, L. Head-Soil & Plant Nutrition, Rubber Research Institute (RRI)
Samarasinghe, G B. Director General, Department of Meteorology
Samarathunga, R H S. Secretary, Ministry of Environment
Sarathchandra, A W M. Director (Planning and Project Implementation), Ministry of Transport
Sathurusinghe, A. Conservator, Forest Department
Senanayake, G. Assistant Director/ERD, Ministry of Finance and Planning
Senevirathne, A. Disaster Management Centre, Ministry of Disaster Mgt. & Human Rights
Silva, A. Director/Policy & Planning, Ministry of Environment
Silva, G B E T. CA/Account Division, Ministry of Environment
Silva, P. Director General, Urban Development Authority
Siyambalapitiya, N. Deputy Director (Planning), Road Development Authority
Sooriyagoda, T. Additional Project Director, Ministry of Tourism
Sugathapala, K. Head- Human Settlements Division, National Building Research Organization (NBRO)
Sumathipala, W L. Senior Technical Advisor, Ministry of Environment
Tharindu, A T H. EMO/CCS, Ministry of Environment
Tissera, H. Consultant Epidemiologist, Epidemiology Unit, Ministry of Health
Udugahapattawa, U. Assistant Director/ERD, Ministry of Finance and Planning
Uyanwatta, P. Ministry of Tourism
Vinodh, T L C. Engineer(R & D), Coast Conservation Department
Warnasuriya, A R. Meteorologist, Ministry of Disaster Management and Human Rights
Wasalabanda, N. Asst. Gen. Manager, Water Resources Board
Weerasori, I S. Deputy Director General, Urban Development Authority
Weerawardane, N D R. Research Officer, Forest Department
Weragoda, U W B A. Deputy General Manager, Coconut Cultivation Board
Werahera, S M. Assistant Director/Air Resources Management, Ministry of Environment
Wickramaarachchi, N D. Assistant Director/NRM, Ministry of Environment
Wickramasinghe, Department of Agriculture
Wickramewardane, K G R G R. Assistant Director, Ministry of Finance and Planning
Wijesinghe, P R. Community Physician, Epidemiology Unit, Ministry of Health
Wijesoriya, W M. Additional Secretary, Ministry of Environment
Wijesundara, D SA. Director, Department of Botanic Gardens
Wijesundara, S M. Director (NRM), Ministry of Agriculture
Wijewardene, K D D. Chief Engineer (R & D), Coast Conservation Department

Universities
Fernando, S. Researcher, Faculty of Science, University of Peradeniya
Gunaratne, L H P. Senior Lecturer, Faculty of Agriculture, University of Peradeniya
Gunatilleke, I A U N. Professor, Faculty of Science, University of Peradeniya
Gunatilleke, S. Professor, Faculty of Science, University of Peradeniya
Kotagama, S W. Professor-Zoology Department, Faculty of Science, University of Colombo
Marambe, B. Professor, Faculty of Agriculture, University of Peradeniya
Meegaskumbura, M. Lecturer, Faculty of Science, University of Peradeniya
Padmalal, U K G K. Senior Lecturer, Open University of Sri Lanka
Perera, A. Senior Lecturer, Faculty of Science, University of Peradeniya
Pushpakumara, D K N G. Professor, Faculty of Agriculture, University of Peradeniya
Silva, P. Senior Lecturer, Faculty of Agriculture, University of Peradeniya
Weerahewa, J. Senior Lecturer, Faculty of Agriculture, University of Peradeniya

Research Organizations
Bahir, M M. Researcher, Taprobania Nature Conservation Society
Balasuriya, A. Junior Professional/PIM, Centre for Poverty Analysis (CEPA)
Dr. Ventatesan, R. SASP Coordinator, South Asia Cooperative Environment programme (SACEP)
Eriyagama, N. Water Resources Engineer, International Water Management Institute (IWMI)
Fernando, K. Senior Professional/PIM, Centre for Poverty Analysis (CEPA)
Manthritilleke, H. Head- Sustainable Development Initiative, International Water Management Institute (IWMI)
Matin, M. Manager, GIS/RS/Data Mgt. Unit, International Water Management Institute (IWMI)
Niranjan, F. Senior Research Officer, Sri Lanka Council for Agricultural Research Policy
Perera, N. South Asia Cooperative Environment programme (SACEP)
Rathnadeera, W K. Senior Programme Officer, South Asia Cooperative Environment programme (SACEP)
Senaratne, A. Research Fellow, Institute of Policy Studies (IPS)
Smakhtin, V. Theme Leader, International Water Management Institute (IWMI)
Tissera, J S. Officiating Director General, South Asia Cooperative Environment programme (SACEP)
Weerakkody, R. Senior Research Officer, Hector Kobbekaduwa Agrarian Research and Training Institute (HARTI)
Wickramasinghe, K. Research Officer, Institute of Policy Studies (IPS)

Non Government Organizations (NGOs)
Ajantha, A. Practical Action
Ariyananda, T. Director, Lanka Rain Water Harvesting Forum
Athukorale, K. Convener, Women for Water Partnership
Chandraratne, G. Programme Officer, Sri Lanka Red Cross Society
Chularatne, H M U. Executive Director, SEVANATHA
Cooray, R. Program Co-ordinator (PIP-SL), Asian Disaster Preparedness Centre (ADPC), DMC

## APPENDIX 2

### Detailed Strategic Interventions Table

<table>
<thead>
<tr>
<th>STRATEGIC THRUST 1: MAINSTREAM CLIMATE CHANGE ADAPTATION INTO NATIONAL PLANNING AND DEVELOPMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Intervention</strong></td>
</tr>
<tr>
<td><strong>A Strengthening national climate-adaptation planning and implementation capacity</strong></td>
</tr>
</tbody>
</table>
| i | Strengthen and restructure Climate Change Secretariat | • Cabinet paper for revised CCS structure approved  
• Qualiﬁed staff recruited  
• New structure operationalized | MoE, MoF CB/IS, PI |
| | The Climate Change Secretariat needs substantial strengthening with an improved structure and adequate staff strength to be able to lead the national climate change adaptation agenda, to effectively coordinate initiatives, and to build its credibility as the primary focal point for authentic climate change related information and analysis. | | |
| ii | Develop of sector specific training programmes on CC adaptation measures | • Number of training programmes conducted  
• Number of technical personnel trained  
• Sectors covered” | Various CB/IS |
| | Climate change vulnerability and adaptation measures vary widely across sectors, requiring speciﬁc training to ensure the success of adaptation interventions. Training programs will have to be developed and implemented on an ongoing basis in parallel with adaptation interventions. An effective modality and hub for delivery of such trainings also needs to be established. | | |
| iii | Introduce climate change studies at university level | • Post-graduate degree programme in climate studies established at one or more of the national universities | Universities CB/IEC |
| | Climate change studies needs to be established at certificate/diploma level as well as at post-graduate level to develop a human resource pool with the depth of knowledge and competence to spearhead and implement Sri Lanka’s climate change adaptation agenda across all key sectors. | | |
| **B Ensure future investments/economic plans are climate resilient** | | | |
| i | Incorporate CC concerns into SEA processes | • Climate Change Policy includes requirement for climate change impact consideration  
• SEA guidelines includes assessment of climate change resilience | MoE/CEA PI |
| | The Strategic Environment Assessment process to be revised to include the consideration of climate change impacts in the early stages of planning for major development initiatives. This will need to be backed by clauses in the Climate Change Policy to make it a requirement for approval. | | |
| ii | Increase knowledge and understanding of climate change among planners and senior technical staff | • Awareness programmes developed and executed  
• Climate change resilience included as part of sectoral planning proposals | Various CB/IS |
| | A systematic programme to expand knowledge and understanding on climate change vulnerability in the Sri Lankan context, targetted at policy makers, planners and senior technical staff in key agencies, is needed. This will help ensure that climate resilience will also be considered as part of the overall assessment of feasibility. | | |
| iii | Quantify economic costs of climate change on specific sectors | • Assessment of economic impact completed and disseminated | MoE/CCS, RPD |
| | A comprehensive assessment and quantification of the economic costs to Sri Lanka due to expected climate change is needed to clarify investment priorities in adaptation. It is also necessary to inform and strengthen Sri Lanka’s negotiating position in international climate negotiations. | | |
### C Systematically research climate change-adaptation options and disseminate knowledge

<table>
<thead>
<tr>
<th>i</th>
<th>Establish coordinated multidisciplinary research programme with widespread dissemination</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A credible hub for national climate change research needs to be established. A systematic, focused, and action oriented research programme on climate change impacts and adaptation measures relevant to each strategic thrust of the CCAS needs to be pursued. Findings need to be fed directly into national planning processes and disseminated widely.</td>
</tr>
<tr>
<td></td>
<td>- National climate change research programme established, with pipeline of research focused on each strategic thrust</td>
</tr>
<tr>
<td></td>
<td>- Research findings</td>
</tr>
<tr>
<td></td>
<td>NSF, Universities, MoE, others</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ii</th>
<th>Model possible future climate scenarios</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Further research is needed to establish a clearer understanding of possible climate change scenarios that may affect Sri Lanka. This is needed to inform adaptation planning processes locally as well as to inform Sri Lanka’s negotiating position in international climate negotiations.</td>
</tr>
<tr>
<td></td>
<td>- Climate scenarios and projections for Sri Lanka published by credible sources</td>
</tr>
<tr>
<td></td>
<td>Dept. of Met., Universities, others</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>iii</th>
<th>Conduct regular national forums on climate impacts on various sectors</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A series of regular national forums on climate change, focused on each strategic thrust, are needed to provide a credible platform for the range of academics, researchers and professionals involved in climate change adaptation to disseminate knowledge and debate ideas. A credible national platform will avert the confusion caused by the proliferation of ad hoc events with little focus.</td>
</tr>
<tr>
<td></td>
<td>- Regular programme of national climate change forums established for each strategic thrust</td>
</tr>
<tr>
<td></td>
<td>CCS, NSF, universities, others</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>iv</th>
<th>Capture, evaluate and disseminate traditional knowledge on adaptive measures</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Traditional measures used in Sri Lanka to adapt to changing environmental conditions across key sectors need to be researched, and where appropriate as an adaptation to climate change, knowledge disseminated and their use scaled up.</td>
</tr>
<tr>
<td></td>
<td>- Scaleable adaptive measures based on traditional knowledge identified and documented</td>
</tr>
<tr>
<td></td>
<td>- Programmes to promote identified adaptation measures initiated</td>
</tr>
<tr>
<td></td>
<td>CCS, NSF, NGOs, others</td>
</tr>
</tbody>
</table>

### D Increase financing for climate change adaptation

<table>
<thead>
<tr>
<th>i</th>
<th>Strengthen NPD/ERD to pursue financing for climate change adaptation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Focused information on climate vulnerabilities in key sectors, supported by well-developed climate change adaptation project proposals to address risks, are needed to enable the Ministry of Finance to allocate and/or pursue potential financing options for major interventions. Such proposals will need to be developed by sector agencies, with support from the Ministry of Environment.</td>
</tr>
<tr>
<td></td>
<td>- Climate change adaptation projects developed and submitted to NPD</td>
</tr>
<tr>
<td></td>
<td>- Volume of financing allocated for climate change adaptation projects</td>
</tr>
<tr>
<td></td>
<td>CCS, MoF, others</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ii</th>
<th>Establish climate change adaptation small grant facility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A small grant facility, which can be administered by a professional body under MoE, is needed to efficiently finance community and local level adaptation interventions. It is envisaged that the fund will be accessible by all stakeholders including civil society groups; have clear guidelines for competitive allocation of resources; and adequate capacity for disbursement and monitoring and evaluation.</td>
</tr>
<tr>
<td></td>
<td>- Small grant facility established and operational guidelines defined</td>
</tr>
<tr>
<td></td>
<td>- Number of proposals approved</td>
</tr>
<tr>
<td></td>
<td>- Funds disbursed and project outcomes achieved</td>
</tr>
<tr>
<td></td>
<td>MoE, MoF, others</td>
</tr>
</tbody>
</table>
iii Establish a multi-sectoral climate negotiation team for Sri Lanka

Assemble a climate negotiation team that include experts from a range of relevant sectors which are impacted by climate change. Such a team to participate in or provide advisory services to national delegations attending all key international negotiations.

iv Support climate-change adaptation regulations with incentives, wherever possible

Improved regulations and guidelines alone do not ensure action. Providing incentives for climate adaptation measures could stimulate greater adoption of measures being promoted. Incentive measures will need to be developed on a case-by-case basis to support interventions being rolled out by various agencies.

| E Inform and mobilize stakeholders at multiple levels in support of climate adaptation |
|---|---|---|---|
| i Effectively engage education system, media and other information ‘multipliers’ |
| To influence and inspire behaviour change, information needs to be disseminated with the active participation of information multipliers, e.g. education system, informal networks of civil society groups, and all sections of the media. These ‘multipliers’ are well positioned and equipped to engage large numbers across social and income levels. However, they need authentic information and guidance on complex, technical matters. |
| • Please refer to Information Education and Communications (IEC) Strategy |
| • Please refer to IEC Strategy |
| ii Make information about adaptation options available at community level |
| Climate adaptation would begin, and be sustained, mostly at the local levels by individuals, families, neighbourhoods and other communities who share climate impacts. The specific information of adaptation methods, technologies and practices therefore need to be made available at these levels in the local languages, and in non-technical and non-proprietary forms. |
| • Please refer to IEC Strategy |
| • Please refer to IEC Strategy |
| iii Promote policy change for climate change adaptation through small group engagement |
| The recent shift to disaster risk reduction (DRR) in Sri Lanka resulted from sustained efforts in engaging in small group level advocacy with the relevant ministries, departments and other state agencies. A similar nurturing of champions and supporters will be needed for CC adaptation. |
| • Please refer to IEC Strategy |
| • Please refer to IEC Strategy |
| iv Engage existing institutional and community-based mechanisms for coordination of adaptation activities |
| Over the years, various formal and informal mechanisms and networks have been developed by the state agencies and some civil society groups engaged in development, conservation or relief work, e.g. in agricultural extension, rural credit, disaster mitigation, water supply and sanitation, etc. It makes sense for the Climate Adaptation Strategy to tap into relevant mechanisms. |
| • Please refer to IEC Strategy |
| • Please refer to IEC Strategy |
v Combat negative anthropogenic activity (such as sand mining)

Climate change adaptation requires both pro-active and preventive interventions. The latter involves curbing various activities that take place at the ground level that weaken or damage the environment’s resilience. These are often result of ignorance, poverty, greed and weak law enforcement. Targeted awareness raising can help contain these, while also strengthening law enforcement and monitoring.

### STRATEGIC THRUST 2:
**ENABLE CLIMATE RESILIENT AND HEALTHY HUMAN SETTLEMENTS**

<table>
<thead>
<tr>
<th>Intervention</th>
<th>Performance Indicator</th>
<th>Key Partners</th>
<th>Activity Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>A Mobilize stakeholders for climate change adaptation of settlements</td>
<td>• Lead agency and coordination mechanism identified</td>
<td>UDA, NWSDB, NWRB, local government agencies, DMC, MoH, others.</td>
<td>PI, CB/IS</td>
</tr>
<tr>
<td>i Establish coordination body/mecanism for climate change adaptation of settlements</td>
<td>• Meetings regularly conducted and include climate change adaptation on the agenda</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ii Promote improved climate resilient construction methods</td>
<td>• Training programmes developed</td>
<td>NBRO, DMC, local gov’t agencies, universities and tech./ voc. training institutes, others.</td>
<td>CB/IS</td>
</tr>
<tr>
<td>iii Support climate change adaptation interventions with incentives</td>
<td>• Incentives for adoption of various technologies/practices offered</td>
<td>Various</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Increase in adoption of given adaptive measure</td>
<td></td>
<td></td>
</tr>
<tr>
<td>B Improve planning to include climate change considerations</td>
<td>• Number of settlements with detailed hazard maps completed</td>
<td>DMC, UDA, local gov. agencies, NGOs, universities</td>
<td>RPD</td>
</tr>
<tr>
<td>i Develop detailed local-level hazard maps for key settlements</td>
<td>• Utilization of hazard maps in planning/ regulation</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**ii Upgrade drainage in key settlements**
Currently drainage systems nationwide are not planned and constructed for the high intensity rainfall patterns that are emerging as a result of climate change. A systematic assessment of drainage systems in key settlements is needed, followed by investments to upgrade existing drainage systems and build new ones if required.

- Assessments of drainage systems in key settlements completed  
- Drainage systems upgraded  
- PHIL

**iii Stimulate greening and increase of canopy cover in settlements and preserve natural ecosystems**
Increasing canopy cover at a household and community level will have immediate benefits to local communities in reducing local temperatures and conservation of water resources, while also having far reaching benefits in conserving biodiversity. This can be achieved through a combination of improved regulations, awareness, and incentives.

- Visible increase in canopy cover  
- Revised planning regulations/guidelines  
- PI, PHIL

**iv Promote land use planning and monitoring for both urban and rural areas**
Land use planning is currently only mandated in designated urban areas under the control of UDA. Regulatory changes and capacity strengthening at multiple levels are required to enable land use planning in non-UDA areas and to control the unplanned sprawl of settlements which are exacerbating climate change-related vulnerabilities.

- Revised regulations calling for land use planning outside UDA areas.  
- No. of land use plans developed and adopted at local level  
- PI

**v Research climate change impacts on human settlements and link to planning**
A concerted body of applied research to better understand climate vulnerabilities specific to Sri Lanka’s settlements and to develop pragmatic and scaleable adaptation measures needs to be launched. Such research needs to have a well defined feedback loop into planning processes and agencies. Strengthening this link is vital, as is the commissioning of specific new research that helps monitor human settlements related trends and conditions.

- Comprehensive research programme designed and funded  
- Research findings/recommendations adopted and implemented.  
- RPD

**C Ensure adequate quality and quantity of water for settlements**

**i Promote water saving technologies including rainwater harvesting**
Several water saving technologies/options have been developed and tested in the Sri Lankan context, but their use is limited. A stepped up campaign, combined with incentives and regulations, is needed to increase adoption of these technologies, particularly in the Dry Zone.

- Level of utilization of water saving technologies by region  
- PI, IEC

**ii Improve monitoring/surveillance and sharing of data across sectors**
Monitoring of data such as water quality/quantity, disease incidence, building approvals, etc. are done by various agencies in Sri Lanka. However, such monitoring programs need to be substantially strengthened and streamlined for cross-sectoral comparability. A mechanism for regular sharing of data needs to be developed and initiated and a capable coordinating entity identified and assigned.

- Water quality monitoring program established  
- Mechanism/platform for data sharing established  
- Regular release/updating of data  
- Data publicly accessible  
- MoH, NWRB, RPD

- UDA, local gov., NGOs. others.
iii Promote integrated water resources and watershed management

- Pilot-scale IWRM initiatives funded and implemented
- Greater awareness and adoption of IWRM principles

Integrated water resource management practices are needed to ensure Sri Lanka’s settlements can cope with climate change vulnerabilities in the water sector. Pilot-scale initiatives should be encouraged to demonstrate benefits. Engagement with stakeholders to ensure policy and regulatory measures are put in place also need to be pursued.

iv Research climate impacts on water availability and develop scalable adaptation models

- Comprehensive research programme designed and funded
- Research findings/recommendations adopted and implemented

The body of research on climate change impacts on water availability for Sri Lanka’s growing settlements is needed—with a clear view towards developing a range of scalable adaptation measures, projects that can be deployed at household and community level, as well as at a larger scale.

D Combat climate change-related health concerns in settlements

i Monitor and control vector borne diseases

- Vector monitoring programme established and operational nationwide
- Ability to predict and respond to outbreaks increased
- Disease incidence rate down

An effective, nationwide, and systematic programme to monitor and control disease vectors (particularly mosquito vectors) which are on the rise with climate change is an urgent need. This will enable better prediction and control of potential outbreaks. Further in-depth research on climate-impacts on vectors is also needed.

ii Facilitate data sharing and compatibility between Ministry of Health and other sectors

- MOH boundaries mapped and georeferenced

An initiative to clearly map MOH boundaries geographically and to define means to enable cross sectoral comparison of the extensive data between MOH divisions and DSDs is crucial. This would be an intervention that will yield very rapid results and have far reaching benefits for climate change adaptation as well as planning in the health sector.

iii Engage health sector experts in local level planning

- Participation of health officials in settlement planning/management meetings at local and national level

More active upstream engagement of health professionals is needed in settlement planning and management, to prevent and control the spread of both communicable and non-communicable diseases associated with climate change and poor environmental management.

iv Research health impacts of climate change in Sri Lankan context

- Comprehensive research programme designed and funded
- Research findings/recommendations disseminated

A wider body of research into the extent and nature of climate change impacts on Sri Lanka’s health sector needs to be pursued.

E Increase awareness on vulnerabilities and adaptation of settlements

i Improve the gathering, processing and dissemination of information related to human settlements

- Please refer to IEC Strategy

Information on the rapidly urbanizing human settlements is scattered across different sectors and agencies, e.g. demographic, geo-spatial, utilities, public health, etc. The integrated approach to climate change adaptation requires pooling and linking such information, which then becomes the basis of timely, targeted adaptation measures and planning.
ii Enhance awareness and demand for climate resilient construction

An aggressive and nationwide program to raise awareness of the construction methods, targeted at technical personnel who are the sources of construction advice, is needed. These personnel include vocational groups such as masons, carpenters, designers, etc. as well professionals and students of architecture, engineering, and planning.

iii Improve coordination/dissemination through existing institutional mechanisms

Improving the currently scattered information gathering and researching processes on human settlements needs to be accompanied by similar measures to enhance the access to resulting information in the public domain. War-time restrictions on geo-spatial data and other information need to be reviewed and removed to enable informed decision making at all levels.

iv Engage media more proactively with messaging tailored for stakeholders

Urban sprawl has seen a parallel explosion in niche media outlets, especially in radio and TV sectors, that target urban audiences. In this multiplicity of outlets, media outreach need not any longer be pursued entirely at all-island level. The urban media can be tapped to deliver specific information to different stakeholders.

---

STRATEGIC THRUST 3: MINIMIZE CLIMATE CHANGE IMPACTS ON FOOD SECURITY

<table>
<thead>
<tr>
<th>Intervention</th>
<th>Performance Indicator</th>
<th>Key Partners</th>
<th>Activity Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>i Ensure ability to meet food production and nutrition demand</td>
<td>Priority: nutrition</td>
<td>Nutrition Dept, Meteorology Dept, Dept of Agric</td>
<td>IEC</td>
</tr>
<tr>
<td>ii Improve weather forecasting and information dissemination</td>
<td>Prioritization of nutritional issues expected to exacerbate with climate change.</td>
<td>Min of Disaster Mangt, Min of Agric</td>
<td>RPD, IEC</td>
</tr>
</tbody>
</table>
iii Ensure easy access to seedstock alternatives/advice to counter rainfall variability

Easy access to seedstock is necessary to help farming communities to adapt to changing rainfall patterns, droughts and floods. To facilitate the process, community level seedstock programs are necessary with a mechanism for rapid distribution. It is also necessary that the seedstock has seed varieties suitable for varied conditions.

- Community level seedstock program
- Technical capacity building program for community on above**

Min of Agric, Civil Society, CBOs

RPD, Phl

iv Research climate impacts/adaptive measures for agriculture, livestock and fisheries sectors

The impacts of climate change on agriculture is yet not fully understood, especially in fisheries and livestock sectors. This knowledge is vital for us to adapt to climate change. It will facilitate the identification of adaptive measures suitable to scale up. Negative aspects on species as well as potential opportunities that climate change may provide should be explored. Impacts on pests, diseases, and IAS need to be better understood and managed. Traditional practices and community level adaptation interventions should also be explored.

- Priority areas for adaptation identified
- Areas for further research
- Adaptation mechanisms identified**

Dept of Agriculture, Vet Res Inst, Dept of Animal Prod and Health, NARA, Min of Fish.

RPD, Health, NARA, Civil Society

v Conserve genetic resources for future crop and livestock improvement

Effective in-situ and ex-situ conservation of relevant germplasm is necessary for future crop and livestock improvement. This will also help them to adapt to the impacts of climate change.

- Update genes banks to address needs of climate change
- Areas identified and protected for germplasm conservation.

Dept of Agriculture, Vet Res Inst, Dept of Animal Prod and Health

RPD

B Ensure adequate water availability for agriculture

i Promote water-efficient farming methods and crops

With increasing incidence of drought due to climate change and the increasing demand on water, a top priority is to ensure food security with the available water resources. For this, water efficient farming practices such as zero tillage, micro irrigation and SRI should be promoted. It is also necessary to promote water efficient crop varieties for future sustainability.

- Water efficient farming techniques promotion program
- Mechanism incentives to promote water efficient crop varieties

Min. of Agric, CBOs, Civil Society

IEC, Civil Society

ii Improve maintenance of existing tanks and reservoirs including catchments and watersheds

In order to meet the increasing water demands under changing climatic conditions, the maintenance of existing reservoir and irrigation systems is necessary to ensure maximum storage capacity. Regular monitoring and maintenance through dredging, as well as prevention of siltation with effective erosion control of tanks and the irrigation systems are potential adaptations. It is also important to control anthropogenic activities such as sand mining.

- Tanks, reservoirs and irrigation systems assessment for maintenance levels,
- Reoration and maintence activities implemeted in rpriority systems

Irrigation Department, Power people

Phl

iii Adopt and promote the principles of IWRM

With the predicted impacts of climate change it is essential that the available water resources are managed wisely. For this, IWRM was be beneficial in dealing with multiple users and in controlling where the water flows. This should be done with better cross-sectoral coordination and consultation. Water requirements for wetlands should also be considered as they are the base for all available water resources.

- IWRM Plan for Sri Lanka
- Adoption of IWRM in Priority River Basins

Irrigation Department, Min. of Agric., Industries, Civil Society

PI, IEC
iv Contract new reservoirs and trans-basin diversions to meet demand

To meet increased water demand for food production, new reservoirs may need to be built. With both floods and droughts expected to increase in the country, possible adaptation interventions could be to divert water from flood prone areas to drought prone areas through trans-basin transfers.

C Mitigate food security-related socioeconomic impacts

i Encourage development of risk transfer methods

With increasing incidences of disasters associated with climate change, the farming and fishing communities become highly vulnerable. To encourage them to continue with their livelihoods which are essential for national food security, risk transfer options such as insurance should be created and promoted.

ii Research climate impacts on long-term food security and agriculture value chains

Research on impacts of climate change on long term food security should be studied along with the how agricultural value chains are affected. This should study the impacts on all activities and processes that lead to a product or service that reaches the final consumer. Dimensions on impacts on the products pathway to reach the final consumer, the key threats to the entire value chain, should be well understood in order to determine adaptation interventions necessary.

iii Identify and help vulnerable fishing communities to adapt or relocate

Marine and lagoon fishing communities are especially vulnerable to climate change due to rising sea level rise as their livelihoods as well as their homes become threatened. Alternate livelihood options should be considered, and re-location programmes promoted in highly vulnerable areas.

D Increase awareness and mobilize communities for climate change adaptation

i Increase awareness on climate impacts on food security and on the potential adaptive measures.

Better information provision to farmers has helped achieve higher agricultural yields in recent decades. A similar campaign is needed to inform farmers and fishermen on climate related impacts on their livelihoods and what adaptive measures are available to cope. Communicating this specific information in accessible, practical ways is critical to building resilience among food producers and others in the value chain.

ii Pilot test and scale up community level agriculture/livestock/fisheries adaptation models

A key lesson from the Green Revolution was the value of demonstrating new methods and practices. This can now be replicated with climate adaptation measures by starting with pilot projects which are then promoted and eventually scaled up.
iii Improve utilization of field level coordination mechanisms and civil society organizations
Crop farming, livestock and fisheries sectors all have well-established extension and support systems in the state sector, sometimes complemented by civil society networks. Both need to be tapped strategically to improve information provision, coordination and monitoring of climate adaptation measures.

iv Promote risk transfer initiatives
Crop and livestock farmers need enhanced insurance support to buffer themselves from climate change impacts. Farmers and insurance industry in Sri Lanka have had limited engagement, so active promotion of new, customised insurance schemes would be needed. This requires working with both insurance operators and farmer organizations or networks.

<table>
<thead>
<tr>
<th>STRATEGIC THRUST 4: IMPROVE CLIMATE RESILIENCE OF KEY ECONOMIC DRIVERS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Intervention</strong></td>
</tr>
<tr>
<td>A Minimize impacts of climate change on infrastructure</td>
</tr>
<tr>
<td>i Identify climate change risks on transport infrastructure</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>ii Update standards/guidelines for infrastructure design and development</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>iii Include climate change adaptations in tourism planning guidelines</td>
</tr>
<tr>
<td>Tourism sector stakeholders need to be made more aware of climate risks and potential adaptive measures they can take at the operator level. The inclusion of climate change adaptive criteria/measures in tourism planning guidelines will ensure greater resilience of investments being rolled out. Such guidelines will need to be developed, adapting from similar work done for human settlements.</td>
</tr>
<tr>
<td>B Minimize impacts of climate change on plantation sector</td>
</tr>
<tr>
<td>i Research climate impacts and adaptive measures in plantation sub-sectors</td>
</tr>
<tr>
<td>A wider body of applied research into the extent and nature of climate change impacts on Sri</td>
</tr>
</tbody>
</table>
Lanka’s plantation subsectors, their productivity, and their competitiveness needs to be defined and pursued.

### ii Pilot test and scale-up sub-sector specific adaptation measures

Climate change adaptive measures in the plantation sector need to be developed where vulnerabilities are significant, pilot tested, and findings made available to industry groups.

### iii Evaluate and exploit potential productivity benefits due to climate change

Further research into the potential positive impacts of climate change on each key plantation sub-sector’s productivity and value chains need to be explored and any opportunities exploited.

### C Assist key industries in coping with climate change impacts

#### i Make sector-specific climate vulnerability information available to investors/regulators

Aside from general climate risk information, sector-specific analysis, maps, and other data related to climate vulnerability--as well as advice on sector-specific measures to build resilience--need to be disseminated to investors/operators/regulators in relevant sectors.

#### ii Encourage climate change risk transfer options for key industries

Risk transfer options such as insurance need to promoted more actively as a means to build resilience and adaptive capacity of industries and entrepreneurs in the face of potential climate-induced risks.

#### iii Research potential climate change impacts/adaptive measures for key industries

The current limited body of research on climate change impacts on Sri Lanka’s key industries needs to be expanded to identify and address risks, and exploit potential opportunities as well.

#### iv Offer incentives for industrial energy saving practices and renewable energy usage

Incentive mechanisms need to be developed and implemented to stimulate greater energy savings and renewable energy use in industry.

### D Raise awareness about climate vulnerability in key economic sectors

#### i Increase climate change awareness at all levels

Climate awareness in key economic sectors is currently low. This calls for urgent raising of knowledge and understanding of climate vulnerabilities, which will help achieve clarity on adaptation options and costs. A balanced approach is needed that factors climate risks into economic sectors as methodically as possible, just as disaster risks have been incorporated in recent years.

#### ii Build capacity for climate change adaptation in key economic sectors

To accomplish (i) above, there needs to be greater technical capacity within each key economic sector. Building such capacity is a key priority in climate change adaptation.
 iii Engage wider stakeholders in dialogue on climate adaptation

The massive upscaling of economic development in the coming decade involves multilateral donors, private foreign investors, local and foreign engineering consultancy firms and insurance companies. Engaging all these stakeholders in addressing climate vulnerabilities and adaptation measures is necessary.

### STRATEGIC THRUST 5:
SAFEGUARD NATURAL RESOURCES AND BIODIVERSITY FROM CLIMATE CHANGE IMPACTS

<table>
<thead>
<tr>
<th>Intervention</th>
<th>Performance Indicator</th>
<th>Key Partners</th>
<th>Activity Type</th>
</tr>
</thead>
</table>
| A Ensure adequate quality and quantity of water for human wellbeing and ecosystem services | • Implementation of IWRM Plan  
• Environmental Flows for major Rivers  
• At least one project using the ecosystem approach for water resource management | Irrigation Department, NWRB, NGOs, others | PI/IEC |
|  
| i Promote efficient water resource use and development using IWRM | • A system to promote multi stakeholder research partnerships in place | CEA, Forest Dept, NSF, universities, others | RPD, CB/IS |
|  
| ii Promote research partnerships on good practices for varied water uses | • Institution for the regulation of water resources  
• Streamlined regulations and policies for water resources | NWRB, Irrigation Dept., others | CB/IS, PI |
B  Enhance climate change resilience of terrestrial ecosystems and their services

i  Link/restore/conserve, forests and other habitat refugia to increase resilience of ecosystems and species

It is necessary to enhance the resilience of forests and other key terrestrial habitats and the species they contain by establishing and effectively managing PAs and other viable wildlife refugia in all climatic zones. The ecosystem approach provides an effective framework for integrated management of PAs, other habitat refuges, and their buffer zones with the participation of all key stakeholders. Special attention should be given to areas with already threatened and endemic, charismatic, relict and/or possible keystone species with high potential to be affected by climate change and the fragmented wet zone forest patches. The latter could be linked via forest plantations, home gardens and crop plantations through participatory approaches based on public sector/local community and private sector partnerships.

ii  Convert monoculture forest plantations into mixed species plantations

There can be adverse impacts of climate change on productivity and resilience of monoculture forest plantations. This can be adressed by converting them into mixed species forest plantations that are also better able to support wildlife, have less pest issues and cause less land degradation and soil water loss. This should be supported by research on plantation species and site species matching.

iii  Promote land use planning for biodiversity conservation and limit inappropriate vegetation conversion

There is a need to minimise inappropriate vegetation conversion and land alienation (especially in hill slopes and paddy lands) and to adopt proper landscape level planning to promote conservation of terrestrial biodiversity based on the land use policy. This can be achieved by use of the ecosystem approach that allows for wide stakeholder participation, zoning land use, and integrated management of forests, associated inland wetlands and/or coastal and agricultural ecosystems, and restoration of forests and canopy cover outside forests with appropriate tree species.

iv  Establish and/or effectively manage Protected Areas and other important wildlife refuges in all climatic zones

It is necessary to enhance the resilience of forests and grasslands and the species they contain by establishing and effectively managing PAs and other viable wildlife refugia in all climatic zones. The ecosystem approach provides an effective framework for integrated management of PAs and other refuges and their buffer zones. Special attention should be given to management of degraded forest fragments in the highly populated wet zone which require enrichment and linkages across forest plantations, home gardens and crop plantations through participatory approaches.
based on public sector/local community and private sector partnerships.

### C Enhance the resilience of coastal and marine ecosystems and associated vulnerable species

| i | Promote integrated coastal resource management, particularly at SAM sites | • Implementation of SAM management at CCD, NARA, PI, CB/IS |
|   | All development activities carried out along the coast should be coordinated and approved by the Coast Conservation Department to ensure that they adhere to the National Land Use Plan, requirements in the Coastal Zone Management Plan (CZMP) and EIA procedures. It is also necessary to prepare and implement new Special Area Management (SAM) Plans and implement existing plans. Integrated coastal zone management should be encouraged at SAM sites in collaboration with all stakeholders. The implementation of CZMP and EIA procedures should be strengthened to reduce inappropriate coastal zone development and habitat degradation through capacity building of technical and planning personnel in CCD and other relevant agencies, and strengthening institutional coordination across agencies active in the coastal zone. |

| ii | Restore and rehabilitate degraded coastal ecosystems and depleted coastal species | • Rehabilitation of key coastal ecosystems CCD, NARA, RPD, Phi |
|    | Many coastal ecosystems are degraded due to poor land use, conversion to other uses, coastal erosion, and pollution. Likewise commercially important species are overharvested. Programmes should be developed with stakeholder participation for sustainable use of coastal resources, including introduction of breeding programmes and pilot testing of sustainable harvest levels for commercially important organisms. |

### D Enhance climate change resilience of natural inland wetlands and associated species

| i | Protect marshes/flood retention areas in urban areas and limit land conversion. | • Regulation with penalties in place for urban wetlands UDA, PI, local gov’t units, NGOs, others |
|    | The protection of marshes and flood retention areas is particularly important in urban areas as urban flooding is already a serious concern due to reclamation of wetlands, and is expected to increase with climate change. Protection of urban wetlands will also enhance and conserve urban biodiversity, thereby enhancing wetland ecosystems and species’ resilience to climate change, and enable provision of vital environmental services for human wellbeing. Marshes and flood retention areas should be protected by restricting development projects in them by declaring them PAs and/or EPAs, or by promoting alternate development (e.g. as recreational sites or urban agriculture) that will enable uninterrupted ecosystem services. |

| ii | Prevent the discharge of industrial effluents and solid waste into inland water bodies | • Regulation with penalties in place for industrial effluents and solid waste CEA, NG0s, local gov’t agencies, others |
|    | It is required to prevent the discharge of industrial effluents, solid waste and other pollutants into inland water bodies by promoting compliance of regulations guiding industrial pollution and wetland conservation, by providing incentives for CSR and strengthening the wetland monitoring system to be effective and regular. | • Cost effective purification programmes developed for release of effluent CEA, PI, IEC |
control and manage salt water intrusion into coastal freshwater wetlands

<table>

<th>Research, monitor and address impacts of climate change on biodiversity</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>Research and monitoring programs to strengthen knowledge base on climate change and terrestrial biodiversity</td>
</tr>
<tr>
<td></td>
<td>Research on and monitoring of the impacts of climate change on terrestrial biodiversity is needed to understand where adaptation interventions are most needed. Vitally important are establishing phenological studies on forest tree species, monitoring critical habitats and fauna most liable to be affected examining climate change impacts on different types of forest flora. Indicator species such as amphibians, freshwater crabs etc should be given special attention. Capacity should be built for monitoring climate change impacts through training programmes on species identification, biodiversity monitoring, behavioural ecology, principles of conservation biology, phenological sampling and maintenance of accurate data sets on rainfall and ambient temperature.</td>
</tr>
<tr>
<td></td>
<td>• Species and ecosystems affected by climate change identified</td>
</tr>
<tr>
<td></td>
<td>• Prioritised list of adaptation interventions needed tailored to ecosystem/species type</td>
</tr>
<tr>
<td></td>
<td>National Science Foundation, Min. of Environment, others RPD</td>
</tr>
</tbody>
</table>
ii Research and monitoring programs to strengthen knowledge base on climate change and aquatic biodiversity

Research and monitoring are required continually to identify threats to freshwater and coastal biodiversity that would be exacerbated by climate change and to understand where adaptation interventions are needed. Monitoring changes in coastal water quality parameters – i.e. acidity, temperature, salinity, is essential. Monitoring of salinity intrusion into surface water is particularly important to enable fishermen to adapt accordingly by selecting appropriate species for aquaculture, and to adapt to changed distribution of species in fishing grounds. Likewise research and dissemination of results are necessary to enable fishermen to change fishing methods and areas, seasons, fishing depths and catch species accordingly. Monitoring freshwater bodies and threatened aquatic species should be encouraged to minimise negative impacts on biodiversity and ecosystem services. Periodic monitoring of ecosystem health in all climatic zones is also vital for early identification of climate change impacts on freshwater species and ecosystems.

iii Minimize entry, establishment and spread of IAS

There is a need to step up preventive measures to preclude entry of new IAS; monitor natural and modified ecosystems to detect establishment of new IAS and the further spread of existing IAS; promote and inculcate skills for monitoring of natural and modified ecosystems to detect climate change impacts in forests (e.g. forest die-back can promote spread of invasive species), coastal areas (e.g. coral bleaching and death has lead to halimedia invasions, etc), and wetlands that may promote spread of IAS, with the support of universities and researchers with appropriate skills and experience. Capacity building is also needed to promote research to expand understanding of behaviour and physiology of selected IAS, and to enhance skills for adaptive management of IAS within institutions responsible for in-situ and ex-situ conservation of national biodiversity.

G Raise awareness and mobilize stakeholders for conservation of biodiversity and ecosystem services

i Focus on minimizing current stresses on ecosystems

It is vital to communicate to all stakeholders the urgent need to resolve long-standing problems in ecosystem conservation before climate change impacts aggravate matters. The key message is: reducing existing stresses on ecosystems will increase natural resilience to climate impacts.

ii Promote training and awareness on use of the ecosystem approach for conservation

While public awareness has risen on conserving species and ecosystems, there is still limited understanding of the newer concepts of ecosystem services. Enhancing this knowledge would help in promoting the integrated, ecosystems-based approach to climate adaptation.
### iii. Build capacity for climate adaptation research among students and staff of conservation agencies

Conservation agencies working in forest, wildlife, aquatic and coastal sectors engage in regular monitoring and studies for their operational needs. They now need to add a new layer of study to assess climate impacts on their sectors and to determine the appropriate adaptation measures. Their research capacity needs to be strengthened.

**Please refer to IEC Strategy**

### iv. Increase public awareness about the value of aquatic and marine ecosystems

Sri Lanka’s climate conditions are influenced by changes in inland wetlands and the ocean surrounding it. Climate adaptation strategies need to factor this in, and especially consider the value of wetlands, and higher vulnerability of coastal ecosystems to impacts.

**Please refer to IEC Strategy**

### v. Engage in dialogue with wider stakeholders

Climate change adaptation can provide a common platform, and new impetus, for pursuing conservation management of biodiversity and ecosystems. An essential first step is to engage all stakeholders, in state, academic, civil society and corporate sectors, on the threats and response options available.

**Please refer to IEC Strategy**
APPENDIX 3

List of Project Concept Notes Available

The following is the index of adaptation project concept notes developed by stakeholders as part of the NCCAS development process. The compilation of concept notes is available in a separate volume with the Climate Change Secretariat at the Ministry of Environment, and includes the contact information of the persons/institutions responsible.

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>iv Capture, evaluate and disseminate traditional knowledge on adaptive measures</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>D Increase financing for climate change adaptation</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>i Strengthen NPD/ERD to pursuit financing for climate change adaptation</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ii Establish climate change adaptation small grant facility</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>iii Establish a multi-sectoral climate negotiation team for Sri Lanka</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>iv Support climate-change adaptation regulations with incentives where possible</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>E Inform and mobilize stakeholders at multiple levels in support of climate adaptation</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>i Effectively engage education system, media and other information ‘multipliers’</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ii Make information about adaption options available at community level</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>iii Promote Policy change for CC adaptation</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>iv Engage exist.inst. and com.-based mech. for coord. of adaptation activities</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>v Combat negative anthropogenic activity (such as sand mining)</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

#### STRATEGIC THRUST 2:
**ENABLE CLIMATE RESILIENT AND HEALTHY HUMAN SETTLEMENTS**

| A Mobilize stakeholders for climate change adaptation of settlements | | | | | | |
| i Establish coordination body/mecchanism for CC adaptation of settlements | | | | | | |
| ii Promote improved climate resilient construction methods | | | | | | |
| iii Support climate change adaptation interventions with incentives | | | | | | |
| B Improve planning to include climate change considerations | | | | | | |
| i Develop detailed local-level hazard maps for key settlements | | | | | | |
| ii Upgrade drainage in key settlements | | | | | | |
| iii Stimulate increase of canopy cover in HS and preserve nat. ecosystems | | | | | | |
| iv Promote land use planning and monitoring for both urban and rural areas | | | | | | |
| v Research CC impacts on human settlements and link to planning | | | | | | |
| C Ensure adequate quality and quantity of water for settlements | | | | | | |
| i Promote water saving technologies including rainwater harvesting | | | | | | |
| ii Improve monitoring/surveillance and sharing of data across sectors | | | | | | |
| iii Promote integrated water resources and watershed management | | | | | | |
| iv Research CC impacts on water availability and dev. adaptation models |
| D Combat climate change-related health concerns in settlements | | | | | | |
| i Monitor and control vector borne diseases | | | | | | |
| ii Facilitate data sharing/compatibility between MoH and other sectors | | | | | | |
| iii Engage health sector experts in local level planning | | | | | | |
| iv Research health impacts of climate change in Sri Lankan context | | | | | | |
| E Increase awareness on vulnerabilities and adaptation of settlements | | | | | | |
| i Improve the gathering, processing and dissemination of info. related to HS | | | | | | |
| ii Enhance awareness and demand for climate resilient construction | | | | | | |
| iii Improve coordination/dissemination through existing institutional mechanisms | | | | | | |
| iv Engage media more proactively with messaging tailored for stakeholders | | | | | | |

#### STRATEGIC THRUST 3:
**MINIMIZE CLIMATE CHANGE IMPACTS ON FOOD SECURITY**

<p>| A Ensure ability to meet food production and nutrition demand | | | | | | |
| i Promote alternative options to meet nutrition requirements | | | | | | |
| ii Improve weather forecasting and information dissemination | | | | | | |
| iii Ensure easy access to seedstock alternatives/advice to counter rainfall variability | | | | | | |</p>
